

Webflow Engineering Interview Prep

This guide outlines what to expect in the interview process and shares best practices to help you prepare

Welcome to Webflow!

At Webflow, our mission is to bring development superpowers to everyone. As the pioneer of the Website Experience Platform (WXP), we're redefining how teams Build, Manage, and Optimize for the web — combining visual development, powerful content management systems, AI-driven personalization, seamless hosting, and end-to-end analytics in a single, unified platform.

With AI at the core, Webflow helps teams move faster, create more performant digital experiences, and scale without heavy engineering support. From independent designers and creative agencies to global enterprises, hundreds of thousands of organizations use Webflow to turn ideas into reality — and to power what's possible on the web.

General Interviewing

- **Zoom and Environment:** Ensure you are in a quiet space with stable internet connection for Zoom.
 - *First time using Zoom?* Please download and test [Zoom](#) at least 15 minutes prior to call. If you run into any issues, please let your scheduler know.
- **Attire:** While Webflow promotes a casual environment, we still remain professional. From business casual to casual, we will accept whatever attire you are most comfortable in.
- **Review the company and its mission:** Research the company and its products or services. Understand the company culture and values. Be prepared to discuss how your skills and experience align with the company's mission and goals.
- **Ask Questions:** If during the interview you are unsure about something you are asked to do, we encourage you to ask questions in order to gain clarity.
- **Need interview accommodations?** It's important to us to create an inclusive workplace for everyone, so please ask if you'd benefit from interview accommodations.

Core Behaviors Interview (60 min)

This interview assesses how your past experiences align with our 4 Core Behaviors. We want to understand how you've approached complex challenges, collaborated with others, and driven meaningful outcomes in your past roles.

1. **Build lasting customer trust.** We build trust by taking action that puts our customer trust first.
2. **Win together.** We play to win, and we win as one team. Success at Webflow isn't a solo
3. **Reinvent ourselves.** We don't just improve what exists, we reimagine what's possible.
4. **Deliver with Speed, Clarity, and Craft.** We move fast because the moment demands it, and we do so without lowering the bar.

We are interested in hearing specific examples that highlight your problem-solving approach, decision-making process, and ability to adapt and grow.

The conversation will focus on Webflow's core behaviors, such as building customer trust, delivering with speed and quality, working effectively across teams, and continuously improving. Reflecting on concrete examples that demonstrate your impact and what you learned from those experiences will help you prepare effectively.

Pro Tip: Use the [STAR](#) method framework to help prepare for behavioral sessions

Fullstack Coding Interview (60 min)

At Webflow, we conduct coding interviews in a supportive and friendly environment where we are eager to witness your problem-solving prowess.

Problem Overview:

In this interview, you'll work on a React + TypeScript coding exercise designed to reflect real-world debugging, optimization, and refactoring tasks. You'll inherit an existing application with some issues to resolve, then progressively improve its functionality and structure.

The focus is less on finishing every part and more on how you approach problems, the quality of your code, how you communicate your reasoning, and—since this is our AI-enabled version—how you use AI tools thoughtfully as part of your workflow. **The use of AI tools is encouraged for this interview.**

You'll be expected to work in your own IDE and environment, so please verify that you have downloaded and run the Codeflow interview shell ahead of time. We will also ask you to share your screen during the interview. We recommend brushing up on React fundamentals (state, effects, controlled inputs, hooks), TypeScript basics, interaction with a server via api, async/promises, and debugging strategies before your session.

Environment and Logistics:

This interview will take place in Zoom and CodeFlow, an open source “shell”, or environment that you’ll set up on your machine prior to this interview. CodeFlow itself does not contain any source code or material specific to this interview. We will also ask you to share your screen during the interview.

Prior to the interview

- You’ll be expected to work in your own IDE and environment, so please verify that you have downloaded and run the Codeflow interview shell ahead of time.
- CodeFlow can be accessed here: <https://github.com/webflow/codeflow>

Beginning of the interview

- Join Zoom and meet your interviewer.
- The interview question will be delivered to you via .zip file that you’ll unzip and place into a directory within CodeFlow to complete the interview from.
- If you have any issues receiving the .zip file or setting it up, your interviewer is there to troubleshoot with you.

How to Succeed:

We recommend brushing up on React fundamentals (state, effects, controlled inputs, hooks), TypeScript basics, interaction with a server via api, async/promises, and debugging strategies before your session.

- The strongest candidates demonstrate clear communication, structured problem solving, and thoughtful tradeoff reasoning rather than memorized solutions.
- We’re looking for candidates who use AI thoughtfully—those who can explain how they prompt, refine, and validate AI-generated code to ensure correctness and performance, demonstrating intentional and critical use rather than simple copy-paste.
- Make sure to ask clarifying questions to ensure you’re tackling the right problem.
- You should be the driver of the conversation, but your interviewer is there to be a sounding board and answer questions you may have. This is not a one-way conversation. We encourage dialogue, as it often leads to richer, more robust outcomes.
- Communication is key. If you arrive at the right solution but haven’t shared your reasoning or thinking, we will lack critical signal for a successful evaluation.

Fullstack System Design Interview (60 min)

Problem Overview:

- This interview will focus on your ability to reason through a full-stack system design problem — covering both frontend and backend aspects, data flow, persistence, and scalability.
- You'll work through an iterative design exercise, starting with a simple commenting system and progressively adding layers of complexity such as real-time updates, notifications, offline handling, and scalability.

What to Expect:

- Expect the discussion to be collaborative and conversational, with your interviewer guiding you through each stage.
- You won't need to produce production-ready code, but you should be prepared to articulate your reasoning, explain trade-offs, and balance simplicity with scalability.
- Visuals or diagrams can be helpful (you can use tools like Excalidraw or Google Docs if you'd like).
- During the session, we're looking for you to sketch out your design, explaining your thought process, decision-making, and trade-offs considered. Your ability to rationalize and justify your design choices is just as important as the final design itself.

How to Succeed:

- We recommend reviewing how you typically reason about data modeling, API design, state management, and real-time systems.
- The strongest candidates demonstrate clear communication, structured problem solving, and thoughtful tradeoff reasoning rather than memorized solutions.
- Make sure to ask clarifying questions to ensure you're tackling the right problem.
- You should be the driver of the conversation, but your interviewer is there to be a sounding board and answer questions you may have. This is not a one-way conversation. We encourage dialogue, as it often leads to richer, more robust design outcomes.
- Communication is key. If you arrive at the right solution but haven't shared your reasoning or thinking, we will lack critical signal for a successful evaluation.

Logistics:

- Please choose a diagramming tool of your choice (gdoc, excalidraw, js.fiddle, figma, etc). At the start of the interview, your interviewer will share the prompt in Zoom chat. You'll then open up your tool, screenshare, and talk through your problem solving as you put together your solution.
- Please be prepared for your interviewer to take screenshots of your finished product for a complete feedback picture of your session.

Tip: Remember, we're not just looking for a correct answer, but also keen to understand how you solve problems, how you communicate your ideas, and how you work within a team.

Wrap-up

Your recruiter will wrap-up with you to check in on next steps, initial feedback, and to share an interview feedback survey with you. Anything you can share with us is invaluable to our interview iteration process.

Good luck

The team is so excited to spend some time with you and get to know your technical strengths! Please let us know what we can do to make this an enjoyable experience! We wish you the best of luck!
